

Multi Directional Forklift

Used Side Loader Forklift Saskatchewan - Side loader forklifts are ideal for lifting long and heavy materials in narrow locations such as warehouse aisles, loading docks, lumber yards, etc. Side loaders have earned their name due to their design and the way they transport, load and unload items. Benefits of Side Loader Forklifts v Standard Forklifts It is common for forklifts that rely on the standard counterbalance design to potentially become unstable when unloading or loading heavy items. However, the side loader forklift is specially designed to handle these types of loads, such as long pipes and raw timber, providing much more stability. Having the load face the direction of travel ensures that timber and steel can be easier to maneuver. Side loaders gift the operator with an unobstructed view. This is often compromised on standard forklifts with the tines or front-carrying load design. Since the loads are transported along the side of the forklift instead of across the front, the side loader can travel easier through narrow aisles and doorways. The load may have to be lowered or raised to get past obstacles that can increase the chances of destabilizing and cause dangerous tip-overs. Side loaders eliminate the need for much of that maneuvering. Operating in narrow warehouse locations is much safer and more accurate with side loaders. Many models can lift up to 12K lbs. while traveling at speeds higher than 5 miles an hour. There may be the ability to have travel speeds programmed. This feature allows the operator to match speed to a specific application. Types of Side Loader Forklifts Class 2 - Electric Motor Narrow Aisle Trucks The Class 2 Electric Motor Narrow Aisle Trucks are where the side loader forklifts are classified. This classification, as the title description suggests, encompasses forklifts that operate in narrow aisles and are powered by an electrical source. Excellent for operating in loading docks and warehouses, these units rely on narrow aisle configuration and are moved between close quarters common for storing lumber, bar stock, laminate and carpet. These machines are additionally used for rack storage and feeding machine tools. The narrow aisle set up is common in warehouses because it allows for the maximum possible use of a storage area which helps to save on costly square footage as well as travel time between material and loading and unloading areas. These Class 2 side loader forklifts are designed to minimize the area taken up by the forklift truck. This design facilitates better speed and efficiency for moving, loading and unloading aisles. Because they are designed primarily for indoor facility use, their electrical power source also means that the harmful emissions that would accumulate from the use of an internal combustion engine are eliminated. Internal Combustion Engine Side Loader Forklifts The Class 2 forklifts only apply to side loaders that use electric power. Units that do not rely on electricity do not fall into this category. Side loaders are found in timber and lumber yards and pipe and steel yards for transporting long and heavy loads. They can move items from flatbed trucks, stack items in blocks or racking. These machines that are used outside have to deal with uneven ground and different temperatures. This means an internal combustion engine and, sometimes, pneumatic tires are a better option for the job. Side loaders are especially popular for these types of applications because the weight and length of materials being handled mean that the side loader forklift can maneuver between narrow stacks, piles or aisles to pick up the long load in their middle which is crucial for loading long items and safely transporting them. Side Loader Forklift Design The side loader forklift comes in two basic designs: 1. Stand on; and 2. Sit down. Stand On Side Loader Forklifts Used mostly indoors in applications such as warehouses, the stand on end control has a small platform area surrounded by the forklift's controls, usually located in the middle of the truck, for the operator to stand. There are many advantages to the stand-on design. Stand-on side loaders don't have an operator seat, allowing for a more streamlined cab design. A forklift operating with a smaller footprint is excellent for working in high-traffic locations. There is better visibility for the operator when working in a standing position, particularly while operating the machine backward. While standing, the operator can turn their body to see the back of the forklift truck while in reverse. In a sit-down machine, operators need to twist their neck and back to get a clear view. Stand-up models have comfort and safety.

Better operator visibility lessens injuries and product damage. Operators can get onto and off of the stand up forklift faster compared to a sit-down model and this may increase efficiency in certain situations.

Sit Down Side Loader Forklifts

Sit-down loaders are more popular than standing loaders. Similar to the side loader stand, the sit-down unit features a centrally located cab. The difference that a sit down forklift has is a raised platform with a seat facing the forklift's control panel. The advantages of a sit down side loader are mostly in operator comfort. The machine enhances productivity and reduces fatigue when operators can work from a resting position.

Customizable Features

The side loader has customizable bed length options to be suitable for many jobs. Custom applications can be met on the job with a sixty-inch extension to further the reach of standard bed length side loaders. Side loaders need to consider aisle widths and guide rails prior to customization. Multidirectional abilities are one of the most popular features of these machines. Side loaders have crab steering to enable them to have two wheels operate separately from others. Crab steering allows the unit to travel in all four directions by changing the direction of the wheels. The side loader can fit into close quarters and narrow spaces without needing to make huge turns or adjustments. The smaller turning radius helps to avoid damage to items and the building while increasing safety. More efficiency is attained since there is less space and time needed to move around the job site. Several other features on side loader forklifts are often customized based on jobsite application. Customizable options include lift capacities, lift mast heights, tine length, mirrors, lights and more. Certain features are also adjustable, allowing for further customization of the side loader for the particular job application. Travel speed, acceleration time, load limits and braking force can all be set allowing further job efficiency and increased workplace safety. For all of the above reasons, the side loader forklift has become the most popular option for workplaces where space is limited and long loads are involved.
